Question workflow

Define workflow from question context

Workflows:

- Bounded context: "Question context"
  - Workflow: "Add question"
    - Triggered by: "User profile"
    - Input: "Question form" (Title, body, tags)
    - Other inputs (validation of the text via ML)
    - Output: "New question accepted"
    - Side effects: User is being notified

Workflows documentation:

- Workflow: "Add question"
- Input: "Question form"
- Output: "New question accepted"

```
//step1
      Complete question form
//step2
      Review question to see if contains inadequate words
      If form is invalid then
            stop
//step3
      Send notification to confirm the question created
//step4
      return "New question accepted" event
```

- Substep: "Validate question form"
  - Input: "Invalidated question form"
  - Output: "Validated question form"
  - Dependencies: "Confirmation message"
- Validate title content
- Validate body content
- If all validations are passed then
  - Return validate question form
  - User gets confirmation message
- Else
  - Return validation error
  - Propose question for manual review
